Project Title:

LIBRARY MANAGEMENT SYSTEM.

Course Name:

Programming in Java.

Subject Code:

CSE2006.

Submitted By:

Vineet Mishra(24BAI10394).

Submitted To:

VIT BHOPAL University.

Date of Submission:

26-03-2026

INTRODUCTION:

This report details the design, implementation, and testing of the Library Management System. This project mainly uses the concept of Object-Oriented Programming, specifically Multilevel Inheritance, to model a real-world library environment. The system provides a functional simulation of standard library operations, offering a modular, efficient, and user-friendly experience.

Problem Statement:

Traditional library systems often require efficient software solutions to manage large volumes of books and users. The core problem addressed in this project is the design and implementation of a simplified, console-based library management system that automates essential operations. The system should manage book records, handle issue and return operations, and maintain data accuracy while ensuring ease of use.

Functional Requirements:

1. Book Management Module:

This system allows the user to add new books by entering details such as Book ID, Title, Author, Genre, and Availability Status.

•Input: User data via console.

•Output: A new Book object is created and stored in memory.

2. Issue and Return Module:

This system allows users to issue and return books. A book can only be issued if it is available.

•Input: Book ID and user action.

•Output: Updated availability status or an error message.

3. Information Display Module:

This system displays all book details, including availability status and issued records.

•Input: User menu selection.

•Output: Formatted book information.

Non-Functional Requirements:

1.Usability:

The system provides an intuitive, numbered console menu for easy navigation.

2.Reliability:

The system handles invalid inputs (e.g., wrong Book ID, invalid options) without crashing and displays appropriate error messages.

3.Performance:

Operations such as issuing and returning books execute efficiently and provide real-time feedback.

4.Maintainability:

The code is modular due to multilevel inheritance, with proper comments and meaningful variable names.

System Architecture:

The system follows a Layered Architecture implemented using Multilevel Inheritance.

- **Presentation Layer:** Handles user interaction through a menu-driven interface.
- **Business Logic Layer:** Contains logic for issuing, returning, and managing books.
- **Data Layer:** Stores book details and their current status.

Design Diagrams:
https://drive.google.com/file/d/19Npp3bIndgQLnTY0BpkRXw-ihxp9q4Xm/view?usp=sharing

Design Decisions & Rationale:

- **Multilevel Inheritance:** Chosen to model a natural "is-a" relationship. A Library System is-a Library Operations which in turn is-a Book. This promotes code reusability and logical structuring of the system.
- **Encapsulation:** All instance variables are declared as protected to allow access to subclasses while restricting access from unrelated external classes.
- **Scanner Object:** Placed in the base class Book so that all derived classes can inherit and use the same Scanner object for input, avoiding resource duplication.

Implementation Details:

The system is implemented in a single .java file for simplicity, but the classes are logically separated. Key implementation aspects include:

- The Library System constructor initializes book details and manages system setup, demonstrating structured initialization.
- Input validation in issue() and return Book() methods ensures data integrity and prevents invalid operations.
- The library Menu() method uses a do-while loop to provide a continuous user experience.

Testing Approach:
A manual black-box testing approach was used.
•**Test Case 1 (Add Book):** Verified correct storage and display of book details.
•**Test Case 2 (Issue Book):** Issued a book successfully when available.
•**Test Case 3 (Issue Unavailable Book):** System displayed "Book not available!".
•**Test Case 4 (Return Book):** Book status updated correctly after return.

Challenges Faced:
•**Challenge 1:** Managing user input errors.
- Solution: Implemented input validation and error handling.

•**Challenge 2:** Designing class hierarchy.
- Solution: Separated responsibilities into different classes logically.

Learnings & Key Takeaways:
•Understood practical implementation of multilevel inheritance.
•Improved knowledge of Java OOP concepts.
•Learned handling of user input and system validation.

Future Enhancements:

- Implement a collection (like an ArrayList) to manage multiple books and users efficiently instead of handling limited records.
- Add a password-based authentication system for secure access to the library system.
- Replace the console interface with a Graphical User Interface (GUI) using Swing or JavaFX.
- Integrate with a database (e.g., MySQL) for persistent storage of book and user data.
- Implement a book reservation system and fine calculation for overdue returns.
